Genes & Genomes in The Tropics 2008 MALARIA & POLYMICROBIAL INTERACTIONS

April 28-May 16, 2008 Kampala (Uganda)

The Karolinska Institutet together with BioMalPar and Makerere University sponsor a three-weeks cross-cutting course designed for motivated students engaged in the understanding of infectious diseases and their molecular interplay.

Leading experts will present recent advances in the biology, immunology and intervention strategy of infectious agents present in the tropics. The course will focus on malaria, in particular *Plasmodium falciparum* and its interactions with other disease-causing microbes (M. tuberculosis, HIV etc).

This competitive international course is intended for PhD students who wish to expand and update their understanding of the field. Combining insights from literature and a variety of scientific experts, with intense laboratory experience, the course focuses on increasing the understanding of infectious diseases present in the tropics, their interactions and impact on human life.

Applications from African students are encouraged.

For further information and applications check the course website
